

WebActivation

Self-Hosted Activation Server

Manage Trial, Product or Subscription licenses protected with QuickLicense, AppProtect or DocProtect using flexible components hosted on your Windows IIS web server.

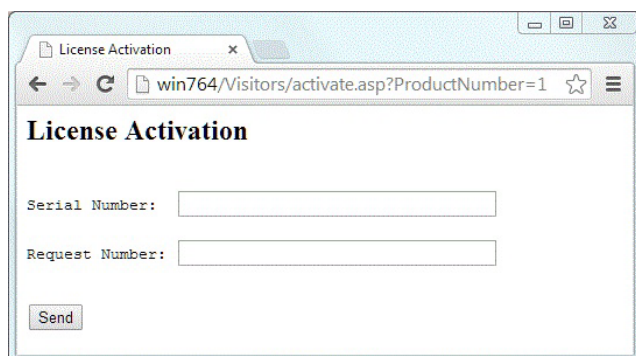

Simple comma separated text files store license and Serial Number data that drives the activation system. Use a simple text editor or the WebActivation application on a Windows computer to edit these data files.

WebActivation was designed for easy integration with existing business systems. Use the default interface files or enhance them to collect customer information during the activation process.

Automate the activation process or integrate it into your order processing system. WebActivation consists of executables and ASP or PHP files placed on your web server. Setup the default activation process in minutes or customize it to your specific requirements.

Use WebActivation to implement a fully automated, browser-less process for license activation, release and restore without vendor involvement.

Activate software on a computer without Internet access using codes exchanged through a web page on any Internet connected computer.

- Control Activation Based on Serial Number
- Securely Move a License Between Computers
- Customize Entire User Experience
- Minimize Website Programming
- Present Computer or Name Specific Activation Codes
- Manage Any Number of Products or Serial Numbers
- License Computers Without Internet Access
- Generate Batches of Serial Numbers
- Manage a Software Subscription by Serial Number
- Suspend a License for a Serial Number

WebActivation can be used to activate and manage any number of digital products or licenses. It works with QuickLicense, AppProtect or DocProtect and your protected products running on Mac, Windows, Linux or Android platforms.

System Requirements

Dedicated Windows web server that supports ASP or PHP files, runs executables and allows an executable to read and write text files in a directory on the web server.

WebActivationRT DLL

WebActivationRT.dll includes the same capabilities as the EXE files but presents a more convenient interface for some web server programming environments. All licensing features are available from either a 32 or 64-bit DLL.
